Amendments to the Claims

1. (Currently Amended) A method for manufacturing a semiconductor device comprising:

forming an N region and P region on a substrate, forming wiring so as to connect one or both of the N and P regions; and

performing a processing step on a semiconductor substrate on which the upper surface of said wiring is exposed using a liquid applied to said semiconductor substrate and a light source radiating light onto said semiconductor substrate,

wherein said processing step is performed in a state in which the wavelength of light radiated onto said semiconductor substrate is 500 nm to less than 1 μ m, and

wherein said processing step is a cleaning step performed during, before or after a step that includes chemical mechanical polishing (CMP) for forming said wiring. wiring, said wavelength of light radiated onto said semiconductor substrate being 500 nm to less than 1 µm in order to reduce an electromotive force at a PN junction in said semiconductor substrate, thereby inhibiting galvanic effects due to photoexcitation before, during or after said step including CMP, and preventing oxidation of a surface of said wiring.

- 2. (Original) A method according to claim 1, wherein said processing step is performed in a state in which said semiconductor substrate is grounded.
- 3. (Canceled).

- 4. (Withdrawn) A processing system comprising a processing unit that processes a semiconductor substrate using a liquid and a light source.
- 5. (Withdrawn) A processing system according to claim 4, wherein said light source radiates light having a wavelength of 500nm to less than 1 μm onto said processing unit.
- 6. (Withdrawn) A processing system according to claim 4, wherein said processing unit provided with a rotating section that holds and rotates a semiconductor substrate, and a liquid supply section that supplies liquid to said semiconductor substrate, and said rotating section being grounded.
- 7. (Withdrawn) A processing system according to claim 5, wherein said processing unit provided with a rotating section that holds and rotates a semiconductor substrate, and a liquid supply section that supplies liquid to said semiconductor substrate, and said rotating section being grounded.
- 8. (Withdrawn) A semiconductor device comprising:
 - a first N region and a P region formed on a substrate;

wiring formed so as to connect either or both of these N and P regions; and

the upper surface of said wiring being exposed to light,

wherein a second N region is formed independent of said first N region on said substrate.

- 9. (Withdrawn) A semiconductor device according to claim 8, wherein the total surface area of said first N region and said second N region is 100 to 1/100 times the total surface area of said P region.
- 10. (Withdrawn) A semiconductor device according to claim 8, wherein said second N region is formed at the periphery of said substrate.
- 11. (Withdrawn) A semiconductor device according to claim 8, wherein said wiring has any one of Cu, Al and W as its main component.
- 12. (Canceled).
